Cursor

Cursor is the work area which Oracle reserves for internal processing of SQL statements. The data which is stored in the cursor is called **Active Data Set**

Cursor is used when you have a SELECT statement that returns more than one row from the database

A cursor is basically a set of rows that you access one at a time

A cursor acts logically as a pointer into a result set

Cursor Attributes

Attribute	Description
%ISOPEN	Returns TRUE if cursor is open
%FOUND	Returns TRUE if record was fetched successfully
%NOTFOUND	Returns TRUE if record was not fetched
%ROWCOUNT	Returns the number of records processed from the cursor

Cursor

Parameterized Cursors

FOR UPDATE Clause

WHERE CURRENT OF Clause

Disadvantages of Cursors

Cursor Operations

- Declare the cursor:
 - *CURSOR cursor_name IS select_query;*
- Open the cursor:
 - *OPEN cursor_name;*
- Fetch the data rows:
 - LOOP
 - FETCH cursor_name INTO variable_name(s);
 - EXIT WHEN cursor_name%NOTFOUND;
 - END LOOP
- Close the cursor:
 - *CLOSE cursor_name;*

OF Clause](#)[Disadvantages of
Cursors](#)

%TYPE and %ROWTYPE

%TYPE

It provides a column type

Variablename tablename.column%TYPE;

Ex: cno Customer.custno%TYPE;

%ROWTYPE

It provides a record type

variablename tablename%ROWTYPE;

Ex: vcust Customer%ROWTYPE;

Implicit Cursor

Explicit Cursor

Steps of Explicit Cursor

Cursor FOR Loop

Parameterized Cursors

FOR UPDATE Clause

WHERE CURRENT
OF Clause

Disadvantages of
Cursors

Implicit Cursor

- It is automatically created & handled by Oracle
- It reserves an area in main memory to populate the data
- It releases the memory area after the processing
- Implicit cursor handles all DMLs, i.e. INSERT, UPDATE & DELETE operations, which affect multiple rows and SELECT statement which returns exactly one row
- You have no control over an implicit cursor
- Implicit cursor attributes are: SQL%ISOPEN, SQL%FOUND, SQL%NOTFOUND, SQL%ROWCOUNT

[Cursor](#)[Cursor Operations](#)[%TYPE and %ROWTYPE](#)[Implicit Cursor](#)[Explicit Cursor](#)[Steps of Explicit Cursor](#)[Cursor FOR Loop](#)[Parameterized Cursors](#)[FOR UPDATE Clause](#)[WHERE CURRENT OF Clause](#)[Disadvantages of Cursors](#)

Implicit Cursor...

An HRD manager has decided to raise the salary of employees by 15%. Write a PL/SQL block to accept an employee number and update the salary of that employee. Display the appropriate message based on the existence of the record in the EMP table

```
BEGIN
    UPDATE EMP SET salary=salary*1.15
        WHERE emp_no=&emp_no;
    IF SQL%FOUND THEN
        DBMS_OUTPUT.PUT_LINE('MODIFIED');
    END IF;
    IF SQL%NOTFOUND THEN
        DBMS_OUTPUT.PUT_LINE('NOT MODIFIED');
    END IF;
END;
```

Implicit Cursor...

An HRD manager has decided to raise the salary of employees working in department 30 by 15%. Write the PL/SQL block to display the number of records updated

```
DECLARE
    rowaff NUMBER(4);
BEGIN
    UPDATE EMP SET salary=salary*1.15 WHERE DEPT=30;
    rowaff: =SQL%ROWCOUNT;
    IF rowaff>0 THEN
        DBMS_OUTPUT.PUT_LINE(rowaff||' Employee
                               records modified');
    ELSE
        DBMS_OUTPUT.PUT_LINE('There is no employee
                               working for dept. 30');
    END IF;
END;
```

Implicit Cursor

Explicit Cursor

Steps of Explicit Cursor

Cursor FOR Loop

Parameterized Cursors

FOR UPDATE Clause

WHERE CURRENT
OF Clause

Disadvantages of
Cursors

Explicit Cursor

- The cursors which are declared by user are called **Explicit Cursors**
- When a SELECT statement returns more than one row of results, we have to use explicit cursor
- We cannot use explicit cursor for DML statements
- Different attributes of explicit cursors are:
 - Cursorname%ROWCOUNT
 - Cursorname%FOUND
 - Cursorname%NOTFOUND
 - Cursorname%ISOPEN

[Cursor](#)[Cursor Operations](#)[%TYPE and %ROWTYPE](#)[Implicit Cursor](#)[Explicit Cursor](#)[Steps of Explicit Cursor](#)[Cursor FOR Loop](#)[Parameterized Cursors](#)[FOR UPDATE Clause](#)[WHERE CURRENT OF Clause](#)[Disadvantages of Cursors](#)

Disadvantages of Cursors

Steps of Explicit Cursor

- **Declare it:**
 - `CURSOR cursorname IS SELECT statement;`
- **Open it:**
 - `OPEN cursorname;`
- **Fetch rows from it:**
 - `FETCH cursorname INTO variableset/ recordname;`
- **Close it:**
 - `CLOSE cursorname;`

Explicit Cursor...

An HRD manager has decided to raise the salary of all the employees in department 30 by 5%. Whenever any such raise is given to the employee, a record for the same is maintained in the Emp_raise table. Write a PL/SQL block to update the salary of each employee & insert into the Emp_raise table

```
DECLARE
    CURSOR CSR IS SELECT e_id, salary FROM EMP
                    WHERE dept=30;
    eid1 EMP.e_id%TYPE;
    sal1 EMP.salary%TYPE;
BEGIN
    OPEN CSR;
    IF CSR%ISOPEN THEN
        LOOP
            FETCH CSR INTO eid1,sal1;
            EXIT WHEN CSR%NOTFOUND;
```

```
...  
...  
...  
    IFCSR%FOUND THEN  
        UPDATE EMP SET salary=salary*1.05 WHERE e_id=eid1;  
        INSERT INTO Emp_raise VALUES(eid1, SYSDATE,  
            sal1*0.05);  
    END IF;  
    END LOOP;  
    COMMIT;  
ELSE  
    DBMS_OUTPUT.PUT_LINE('Unable to open the cursor');  
END IF;  
CLOSE CSR;  
END;
```

Steps of Explicit Cursor

Cursor FOR Loop

Parameterized Cursors

FOR UPDATE Clause

WHERE CURRENT OF Clause

Disadvantages of Cursors

Cursor FOR Loop

In cursor FOR loop, you do not have to explicitly open and close the cursor. It is automatically done by FOR loop

```
FOR variable IN cursorname  
    LOOP  
        Statements  
    END LOOP
```

Cursor FOR Loop...

An HRD manager has decided to raise the salary of all the employees in department 30 by 5%. Whenever any such raise is given to the employee, a record for the same is maintained in the Emp_raise table. Write a PL/SQL block to update the salary of each employee & insert into the Emp_raise table

```
DECLARE
    CURSOR CSR IS SELECT e_id,salary FROM EMP
                    WHERE dept=30;
BEGIN
    FOR i IN CSR
    LOOP
        UPDATE EMP SET salary=i.salary*1.05
            WHERE e_id=i.e_id;
        INSERT INTO Emp_raise VALUES(i.e_id, SYSDATE,
            i.salary*0.05);
    END LOOP;
    COMMIT;
END;
```

OF Clause

Disadvantages of
Cursors

Parameterized Cursors

Parameters in cursors are useful when a cursor is required to be opened based on different set of parameter values

The parameter makes the cursor more reusable

A cursor with parameter can be opened and closed several times. Each time a new active set is loaded in the memory and the pointer is placed at first

**CURSOR cursorname (parametername type,
parametername type) IS SELECT statement;**

Parameterized Cursors...

Display the name and designation of employees corresponding to the inputted deptno

```
DECLARE
    vname EMPLOYEE.ename%TYPE;
    vdesg EMPLOYEE.designation%TYPE;
    did NUMBER(2);
    CURSOR empocr(deptno EMPLOYEE.dno%TYPE) IS SELECT
        ename, designation FROM EMPLOYEE WHERE dno=deptno;
BEGIN
    did := &did;
    OPEN empocr(did);
    DBMS_OUTPUT.PUT_LINE('Employee in dept.'||did);
    LOOP
        FETCH empocr INTO vname, vdesg;
        EXIT WHEN empocr%NOTFOUND;
        DBMS_OUTPUT.PUT_LINE(vname||' '||vdesg);
    END LOOP;
    CLOSE empocr;
END;
```

Cursor FOR Loop

Parameterized Cursors

FOR UPDATE Clause

WHERE CURRENT OF Clause

Disadvantages of Cursors

FOR UPDATE Clause

It is used to lock rows before updating or deleting of records

It is added in the cursor query to lock the affected records when cursor is opened

Oracle server releases the lock at the end of the transaction

It is used to ensure that the record is not changed by another user before the update or delete

**CURSOR cursorname IS SELECT columns FROM tables
WHERE *con^d* FOR UPDATE [OF columns] [NOWAIT];**

WHERE CURRENT OF Clause

It is used for referencing the current row of the active set retrieved by the explicit cursor

It allows to apply updates & deletes to the row currently being accessed without referencing ROWID

UPDATE tablename SET clause WHERE CURRENT OF cursorname;

DELETE FROM tablename WHERE CURRENT OF cursorname;

WHERE CURRENT OF clause references the cursor and changes only to the last fetched row

[Cursor](#)[Cursor Operations](#)[%TYPE and %ROWTYPE](#)[Implicit Cursor](#)[Explicit Cursor](#)[Steps of Explicit Cursor](#)[Cursor FOR Loop](#)[Parameterized Cursors](#)[FOR UPDATE Clause](#)[WHERE CURRENT OF Clause](#)[Disadvantages of Cursors](#)

Explicit Cursor

Write the PL/SQL block which increases the salary of the employees of the dept 10 & 30 with the locking of the records

```
DECLARE
    vrec EMPLOYEE%ROWTYPE;
    CURSOR cremp IS SELECT * FROM EMPLOYEE WHERE
        deptno IN (10,30) ORDER BY deptno FOR UPDATE OF
            deptno, salary NOWAIT;
BEGIN
    OPEN cremp;
    LOOP
        FETCH cremp INTO vrec;
        EXIT WHEN cremp%NOTFOUND;
        UPDATE EMPLOYEE SET salary=vrec.salary*1.1
            WHERE CURRENT OF cremp;
    END LOOP;
    CLOSE cremp;
END;
```

FOR UPDATE Clause

WHERE CURRENT OF Clause

Disadvantages of Cursors

Disadvantages of Cursors

It uses much more network bandwidth

It allocates resources at the server

If the cursor is not properly closed, the resources will not be freed until the SQL session itself is closed
